

Encode® Emergence Healing Abutments

Heal Naturally. Impress Easily.

1 Natural Tissue Healing

- Healing abutments designed with natural gradual emergence profiles.
- Bone profiling mitigation may be possible when implant is placed no deeper than 1 mm below bone crest.
- Available in a range of emergence profile diameters and in three heights: 3, 5 and 7 mm.

2 Simplified Intraoral Scans or Traditional Impressions

- Eliminate the need for impression copings. Use an intraoral scanner or traditional PVS impression to transfer implant position for final restoration production.
- Code scheme designed to allow intraoral scanning or PVS impressing when healing abutment occlusal is just above the surrounding soft-tissue providing aesthetics post-surgery.

3 Hard- and Soft-Tissue Preservation

- Intact peri-implant mucosa is required for oral health and successful dental Implant integration and maintenance.¹
- Multiple abutment removals (dis/reconnect) negatively affect periabutment mucosal and contributes to loss of alveolar crestal bone.²
- Encode Emergence design reduces need for multiple abutment removals, preserving peri-abutment interface and maintaining sealing function.

4 Pink Matte Appearance

- Pink color provides for closely matching the gingiva's color for aesthetics results after surgery.
- Matte appearance for reduced intraoral scan glare for clear scan images.
